**Alendronic Acid**

**Etidronate**

**Pamidronate**

**Risedronate**

**Zoledronic Acid**

Used to treat osteoporosis and related bone loss diseases — such as Paget's disease.

Osteoblasts create bone, while osteoclasts destroy bone.

Bisphosphonates encourage osteoclasts to undergo apoptosis, thereby slowing the rate of bone loss.

Bisphosphonates are poorly absorbed from the gut. Advised to be taken on an empty stomach — with a full glass of water — while remaining upright for at least 30 minutes.

Alendronate, etidronate and risedronate are available for oral use, whereas pamidronate and zoledronic acid are available intravenously.

Pyrexia and flu-like symptoms tend to occur after the first intravenous use.
